AMENDMENTS TO THE CLAIMS

This listing of claims replaces all prior versions of claims in the application.

- 1. (Withdrawn): A semiconductor device comprising:
- a silicon substrate;
- a gate insulation film formed over said silicon substrate; and
- a gate electrode formed over said gate insulation film,

silicon atoms on a surface of said silicon substrate being displaced toward said gate insulation film side.

- 2. (Withdrawn): The semiconductor device according to claim 1, wherein a conductive type of said surface of said silicon substrate is P-type below said gate insulation film.
- 3. (Withdrawn): The semiconductor device according to claim 1, wherein a displacement amount of said silicon atoms on said surface of said silicon substrate is 0.0075 nm or more.
- 4. (Withdrawn): The semiconductor device according to claim 3, wherein said displacement amount is 0.01 nm to 0.03 nm.
 - 5. (Withdrawn): A semiconductor device comprising:
 - a silicon substrate;

a gate insulation film formed over said silicon substrate; and

a gate electrode formed over said gate insulation film,

silicon atoms on a surface of said silicon substrate in a region where a conductive type of said surface is P-type below said gate insulation film being displaced toward said gate insulation film side, and

silicon atoms on said surface in a region where said conductive type of said surface is N-type below said gate insulation film being displaced toward an inner side of said silicon substrate.

6. (Withdrawn): The semiconductor device according to claim 5, wherein

a displacement amount of said silicon atoms in said region where the conductive type of said surface is N-type is 0.01 nm to 0.03 nm, and

a displacement amount of said silicon atoms in said region where the conductive type of said surface is P-type is 0.01 nm or less.

7. (Withdrawn): The semiconductor device according to claim 1, wherein said gate insulation film comprises:

a silicon oxide film containing nitrogen and formed over said silicon substrate; and a silicon nitride film or high dielectric constant film formed over said silicon oxide film.

8. (Withdrawn): The semiconductor device according to claim 1, wherein said gate insulation film comprises:

Amendment under 37 CFR § 1.116 Serial No. 10/809,809 Attorney Docket No. 042278

> a silicon oxide film containing nitrogen and formed over said silicon substrate; a high dielectric constant film formed over said silicon oxide film; and

9. (Previously Presented): A manufacturing method of a semiconductor device comprising the steps of:

a silicon nitride film formed over said high dielectric constant film.

forming a gate insulation film over a silicon substrate; and forming a gate electrode over said gate insulation film, said step of forming a gate insulation film including the steps of:

forming a silicon oxide film over said silicon substrate, said silicon oxide film having a thickness of 1.5 nm or less; and

introducing nitrogen into said silicon oxide film and displacing silicon atoms on a surface of said silicon substrate toward said gate insulation film side.

- 10. (Original): The method according to claim 9, wherein said step of introducing nitrogen and displacing silicon atoms comprises the step of conducting a first heat treatment to said silicon oxide film in an ammonia atmosphere or nitrogen monoxide atmosphere.
- 11. (Original): The method according to claim 9, wherein said gate insulation film is formed over a region where a conductive type of said surface of said silicon substrate is P-type.

Amendment under 37 CFR § 1.116 Serial No. 10/809,809

Attorney Docket No. 042278

12. (Previously Presented): A manufacturing method of a semiconductor device

comprising the steps of:

forming a gate insulation film over a silicon substrate; and

forming a gate electrode over said gate insulation film,

said step of forming a gate insulation film including the steps of:

forming a silicon oxide film over said silicon substrate, said silicon oxide film having a

thickness of 1.5 nm or less; and

introducing nitrogen into said silicon oxide film, displacing silicon atoms on a surface of

said silicon substrate in a region where a conductive type of said surface is P-type below said

gate insulation film toward said gate insulation film side, and displacing silicon atoms on said

surface in a region where said conductive type of said surface is N-type below said gate

insulation film toward an inner side of said silicon substrate.

13. (Original): The method according to claim 12, wherein said step of introducing

nitrogen and displacing silicon atoms comprises the step of conducting a first heat treatment to

said silicon oxide film in a ammonia atmosphere or nitrogen monoxide atmosphere in said region

where the conductive type of said surface is P-type, and conducting a plasma nitridation

treatment to said silicon oxide film in an ammonia atmosphere or nitrogen monoxide atmosphere

in said region where the conductive type of said surface is N-type.

14. (Original): The method according to claim 10, wherein said first heat treatment is

conducted at 775°C or higher.

Serial No. 10/809,809

Attorney Docket No. 042278

15. (Currently Amended): The method according to claim 9, wherein said step of

forming a gate insulation film comprises the step of forming a silicon nitride film or high

dielectric constant film over said silicon oxide film by a deposition method, after said step of

introducing nitrogen and displacing silicon atoms.

16. (Original): The method according to claim 15, wherein said step of forming a gate

insulation film comprises the step of conducting a second heat treatment to said silicon oxide

film, to which nitrogen has been introduced, after said step of forming a silicon nitride film or

high dielectric constant film.

17. (Original): The method according to claim 16, wherein said second heat treatment is

conducted at a higher temperature than that at which said silicon nitride film or high dielectric

constant film is formed.

18. (Original): The method according to claim 9, wherein said step of forming a gate

insulation film comprises the steps of, after said step of introducing nitrogen and displacing

silicon atoms:

forming a high dielectric constant film over said silicon oxide film;

conducting a second heat treatment to said silicon oxide film, to which nitrogen has been

introduced; and

forming a silicon nitride film over said high dielectric constant film.
